If I have a class that has 3 instance variables: class Car attr\_accessor :vin, :brakes, :owner end I can create instances of this class and store them in an array of class Car. But this only works if all the instance variables are of the same type. For example, if I wanted to store Vehicle objects in my array instead of just Car objects, I have to create an array of Vehicle objects. Can I just store objects of multiple classes in the same array or do I need to explicitly create an array of each class and then copy the values from an array of one class to an array of another class? A: Yes, you can store different classes in the same array. You don't need to do any copying. They will just be accessible through the same keys: a = [Car, Car, Car] a[0].vin # => "12345" a[1].brakes # => "wibble" a[2].owner # => "Dave" I would advise against storing Car objects in an array in general, though. The problem is that there are mutable (e.g. the brake can be changed) and immutable objects (e.g. the vin cannot be changed) in your cars array, and it's not clear where the mutability ends. A more proper way to store a list of Cars would be a hash of Car objects. class Car def initialize(vin, brakes, owner) @vin = vin @brakes = brakes a1d647c40b
